A: I am not 100% sure what you are trying to accomplish here, but if you use the below code (changing your parameters as required) then you should get the results you want in your.csv file: \$path = "C:\Users\mdr\Downloads\\*.wmv"; \$content = @(); foreach(\$path as \$file) { \$content.= Get-Content \$file; \$content | Select-Object -skip 2 | Export-Csv "C:\Users\mdr\Downloads\output.csv" -NoTypeInfoInformation } If you want to capture the output using WScript.StdOut instead of having to run the commands in your PowerShell window you can use the below: \$path = "C:\Users\mdr\Downloads\\*.wmv"; \$content = @(); foreach(\$path as \$file) { \$content.= Get-Content \$file; \$content | Select-Object -skip 2 | Export-Csv "C:\Users\mdr\Downloads\output.csv" -NoTypeInfoInformation | Out-File "C:\Users\mdr\Downloads\output.csv" } Edit: Taking your update into consideration, the below should do the trick: \$path = "C:\Users\mdr\Downloads\\*.wmv"; \$content = @(); \$selector = [regex]::Match(\$path, '\.wmv\$'); \$i = 1; foreach(\$path as \$file) { \$content.= Get-Content \$file; \$content | Select-Object -Skip (\$selector -l \$i) | Export-Csv "C:\Users\mdr\Downloads\output.csv" -NoTypeInfoInformation \$i += 1 } You may need to play around with the skip and select-object command. If this doesn't work there may be some superfluous text/numbers in your files. This will skip the first 2 lines, then select the next 2 lines. To try the first version: \$path = "C:\Users\mdr\Downloads\\*.wmv"; \$content = @(); \$select

address when under load I'm using  
console.log(require('net').getIfAddr(req).address) to get the ip address of  
the server. The problem is that I'm only able to get the ip address when the  
load on the server is 1 the server never recovers and has a new ip address  
assigned Any ideas how to get the IP address when the load is > 1? A: You  
could use IPFS as in this repo and also here - but as you can see from the  
comments, IPFS isn't meant to be an ultimate solution to that problem. A:  
You should be using a load balancer in front of your webserver. As far as I  
know, load balancers are used to ensure that requests get handled by the  
same server instance, rather than different instances. A good load balancer  
for nodejs would be haproxy. If your load balancer isn't supported by  
haproxy, you could also try nginx. Nearby Transit Nearby Schools School
